FOR 3PLS & FULFILLMENT

Put the right stock **in the right node.**

3PLs own fulfillment, the warehouses, the pick-pack, the last mile across many nodes. What they don't own is the demand plan that decides how much of each SKU should sit in each node. Tightly does. **You move the goods; Tightly decides what goes where.**

HOW TIGHTLY FITS

1 · FORECAST

In Tightly

ML demand at SKU, channel and region, so every node is stocked to its own real demand.

2 · FULFIL

In your network

The 3PL receives, stores and ships against a plan that reflects where demand actually is.

3 · REBALANCE

Back in Tightly

Throughput + on-hand flow back; agents rebalance and replenish before a node runs short.

Bad placement is expensive on both sides: split shipments, idle storage, stockouts in the wrong region. **Demand-aware placement fixes it.**

MUTUALLY BENEFICIAL, THREE WAYS

FOR THE 3PL

- Better utilization and fewer split shipments across your nodes.
- A planning value-add you offer without building it.
- Stickier clients who scale their volume on your network.

FOR YOUR CUSTOMERS

- The right inventory in the right node, higher fill, faster delivery.
- Less capital trapped in slow-moving stock.
- One plan across every node and channel.

FOR TIGHTLY

- Real-time throughput + on-hand as a live signal.
- Distribution into your brand base via referral.
- Fulfillment our brands already need.

THE INTEGRATION

Tightly reads on-hand and throughput per node (API or file) and stages replenishment, transfers and POs back. Multi-node allocation is native, your DCs are first-class.

THE ASK

A 30-minute session to scope a pilot on two or three shared clients across your nodes.

Then a referral motion and a listing as a recommended planning partner.
