

FOR EDI & INTEGRATION NETWORKS

Turn your data pipes into the buy.

EDI networks move the transactions, POs, ASNs, and the 852 product-activity data that carries real sell-through. That is demand signal in motion. Tightly turns it into a plan and sends POs back out through you. **You move the documents; Tightly turns them into decisions.**

HOW TIGHTLY FITS

1 · INGEST

From your network

Tightly reads 850 POs, 852 sell-through / on-hand and 856 ASNs as demand signal.

2 · PLAN

In Tightly

ML forecast + merchandise plan reconciled against that live signal.

3 · TRANSACT

Back through you

Tightly generates POs and replenishment that flow back out over EDI.

- ✦ 852 product-activity data is one of the richest demand signals in retail, and most of it sits unused. **Tightly makes it decide the buy.**

MUTUALLY BENEFICIAL, THREE WAYS

FOR THE PLATFORM

- Your data becomes a decision, not just a pipe.
- More transaction volume, Tightly-generated POs flow over your network.
- A planning partner your customers ask for.

FOR YOUR CUSTOMERS

- The 852 / POS data they already exchange, finally driving the forecast.
- One plan across every trading partner.
- Fewer stockouts and cleaner replenishment.

FOR TIGHTLY

- A clean demand signal at scale.
- Distribution into your trading-partner base.
- Standards-native data, no custom rails.

THE INTEGRATION

Tightly consumes 850 / 852 / 846 / 856 as forecast input and emits POs and replenishment back over your network. Standards-native, no bespoke connectors.

THE ASK

A 30-minute session to scope a pilot on two or three shared trading partners.

Then a referral motion and a certified listing.

WHAT TIGHTLY IS

One platform, every planning job.

Tightly runs the forecast, the plan and every in-season move on one model, so they all read the same numbers. Change one and the rest reconcile, before you commit the buy.

Every planning job, one model

DEMAND

See demand before it lands.

- 01 **Forecast**
ML demand for every SKU, channel and week
- 02 **New products**
modelled from look-alikes before they trade
- 03 **Seasonality**
shape learned from your own history
- 04 **Confidence**
a range on every line, not a single point

PLAN

Turn the forecast into a buy.

- 01 **Merch plan**
targets reconciled to the forecast
- 02 **Assortment**
the range that sits inside the plan
- 03 **Open-to-buy**
the buy budget, held in line
- 04 **Scenarios**
test a change, watch it reconcile

INVENTORY

Stock where demand actually is.

- 01 **Allocation**
to doors and channels by demand
- 02 **Purchasing**
POs raised inside open-to-buy
- 03 **Replenishment**
reorder to live sell-through
- 04 **Transfers**
rebalance stock across locations

IN-SEASON

Trade the plan as sales land.

- 01 **Re-forecast**
rerun every week on the latest sales
- 02 **Pricing**
moved where it actually pays
- 03 **Markdown**
timed to clear stock on plan
- 04 **Tia**
proposes the next move inside your limits

THE PLATFORM

Three layers, one connected plan.

Tightly runs your data, your plan and Tia, its planning copilot, on one model. Demand drives the buy, and Tia works the plan inside the limits you set. Change one layer and it carries through to the rest.

DATA & PLATFORM

01

Your data, unified

POS, e-commerce, ERP, EDI, costs and suppliers on one governed model, current to the minute.

- POS, e-commerce, ERP and WMS
- EDI and supplier feeds
- Costs, margins and product data
- One governed model, always live

CONNECTED PLAN

02

One plan, one number

Forecast, merch plan, open-to-buy, allocation, replenishment and pricing, all on one number.

- Forecast, merch plan and open-to-buy
- Assortment, allocation and replenishment
- Pricing and markdown
- Change one, the rest reconcile

TIA

03

Your planning copilot

Tia works demand, buying, markdown and margin as one copilot, inside the limits you set.

- One copilot across the whole plan
- Works inside the limits you set
- Proposes the next move
- Every step logged

WORKED EXAMPLE

DATA → PLAN → TIA

Tia sees the **Yarrow Wide-Leg Dungaree running 12% ahead of plan** (+1.4% vs last year) in DTC. She drafts a **\$44k reorder that fits inside open-to-buy**, holds the wholesale buy flat and pushes the end-of-season markdown out two weeks. You approve the move, and the forecast, the buy and the cash position reconcile together.

THE FORECAST

Start with a forecast you can **trust**.

Tightly forecasts demand for every SKU and channel on a model calibrated at retail scale and trained on your own history, and re-forecasts every week as sales come in. On core DTC demand it holds error to a 9% wMAPE, about half a last-year-repeat forecast, and shows you exactly where the harder channels run wider.

Forecast against actuals, per SKU × channel × week, with the 90% confidence band and event markers.

ACCURACY YOU CAN CHECK

Your corpus, at scale

learns from your own sales history, calibrated against retail demand at scale

Backtested before it plans

validated on held-out weeks, so accuracy is measured, not asserted

Benchmarked to a baseline

reported per channel against a last-year-repeat forecast, not against itself

THE CONNECTED PLAN

Change one number, the **plan reconciles**.

One forecast you can rely on sits under the merchandise financial plan, category plans and open-to-buy. Move a target or test a scenario and Tightly reconciles the rest, so you see the impact before you commit the buy.

One forecast sits under the whole plan. Move a target or test a scenario and Tia re-solves the merchandise plan, the category buys, the margin and open-to-buy around it, so the numbers never drift apart.

You see the downstream impact before you commit the buy, and every team plans from one reconciled number.

WHAT CHANGES

Fewer markdowns

clear on plan, not in a panic

Fewer stockouts

reorder before winners run dry

Freed-up capital

less cash in dead stock

One set of numbers

finance, planning, buying aligned
